## SEMM2413/SKMM2413 THERMODYNAMICS TEST 2

1 hour 30 min

## INSTRUCTION: ANSWER ALL QUESTIONS

## QUESTION 1 (20 marks)

a) A rigid recovery cylinder has a volume of $0.02 \mathrm{~m}^{3}$, contains Refrigerant R-134a as shown in Figure Q1. Initially, the density and temperature of the refrigerant are $85 \mathrm{~kg} / \mathrm{m}^{3}$ and $48^{\circ} \mathrm{C}$, respectively. Due to heat transfer to the refrigerant, its pressure and temperature were observed to increase until it becomes saturated vapor. Show the process on a $T-v$ diagram with respect to saturation lines, and determine,
i) the final temperature of the refrigerant, ${ }^{\circ} \mathrm{C}$,
ii) the heat transfer to the refrigerant, $k J$.
(14 marks)

Fig. Q1
b) The United States Environmental Protection Agency (US EPA) has specified that the temperature of recovered refrigerant inside the rigid recovery cylinder must not exceed $52^{\circ} \mathrm{C}$ for safety reasons. To satisfy this requirement, the saturated vapor in part a) above needs to be cooled to a mixture at $52^{\circ} \mathrm{C}$ by removing heat from the refrigerant. Determine the amount of heat (kJ) that needs to be removed from the refrigerant.
(6 marks)

## QUESTION 2 (20 marks)

Air enters the compressor of a power plant steadily at ambient conditions of 101 kPa and $30^{\circ} \mathrm{C}$ with a velocity of $120 \mathrm{~m} / \mathrm{s}$. The air leaves at 6 MPa and $300^{\circ} \mathrm{C}$ with a velocity of $50 \mathrm{~m} / \mathrm{s}$. The diameter of the compressor inlet is 40 cm . A cooling liquid is used to cool the compressor at a rate of $1500 \mathrm{~kJ} / \mathrm{min}$. Only the change in potential energy can be neglected. Air can be assumed as ideal gas, take $\mathrm{R}=0.287 \mathrm{~kJ} / \mathrm{kg} . \mathrm{K}$ and $\mathrm{c}_{\mathrm{p}}=1.005 \mathrm{~kJ} / \mathrm{kg} . \mathrm{K}$.
i) Determine the mass flow rate of air through the compressor, $\mathrm{kg} / \mathrm{s}$.
ii) Determine the outlet diameter of the compressor, mm .
iii) Determine the volume flow rate of the air at compressor inlet, $\mathrm{m}^{3} / \mathrm{min}$.
iv) Calculate the power required by the compressor, $\mathrm{k} W$.

QUESTION 3 (20 marks)
a) Write down two factors that cause a process to be irreversible. (4 marks)
b) A Carnot heat engine receives 650 kJ of heat from a source of unknown temperature and rejects 250 kJ of heat to a sink at $24^{\circ} \mathrm{C}$. Determine,
i) the temperature of the source,${ }^{\circ} \mathrm{C}$,
ii) the thermal efficiency of the heat engine, $\%$.
c) A heat engine operates by receiving heat from a reservoir at $900{ }^{\circ} \mathrm{C}$ at a rate of $800 \mathrm{~kJ} / \mathrm{min}$ and rejects heat at a rate of $560 \mathrm{~kJ} / \mathrm{min}$ to the ambient air at $27{ }^{\circ} \mathrm{C}$. The entire work output of the heat engine is used to drive a refrigerator that removes heat from the refrigerated space at $-5^{\circ} \mathrm{C}$ and rejects heat to the same ambient air at $27^{\circ} \mathrm{C}$.
i) Sketch the schematic diagram of the engine-refrigerator system.
ii) Determine the thermal efficiency of the heat engine, $\%$.
iii) Determine the maximum thermal efficiency of the engine if it operates on a reversible cycle, $\%$.
iv) Determine the maximum COP of the refrigerator if it operates on a reverse Carnot cycle.
v) Determine the maximum rate of heat removal from the refrigerated space, $\mathrm{kJ} / \mathrm{s}$.
vi) Determine the rate of heat rejection to the ambient air from the refrigerator, $k J / s$.

## APPENDIX (PROPERTY TABLES)

## Solution for Q1(a):

Refrigerant R-134a is filled in a recovery cylinder with initial conditions of $20 \mathrm{~L}, 85 \mathrm{~kg} / \mathrm{m}^{3}$, and $48^{\circ} \mathrm{C}$. After sometimes, the temperature and pressure of the refrigerant increase due to heat transfer until it becomes saturated vapor. The cylinder is a closed system. Thus its volume is constant. The final temperature, pressure, and heat transfer are to be determined.

## Assumptions:

1) The system is stationary and thus the kinetic and potential energy changes are zero.
2) The direction of heat transfer is to the system (heat gain, $Q_{i n}$ ).
3) The volume of the rigid tank is constant, and thus there is no energy transfer as boundary work.
4) There is no electrical, shaft, or any other kind of work involved.

## Analysis:

Consider the contents of the cylinder as the system. This is a closed system since no mass

## State 1:

$T_{1}=48^{\circ} \mathrm{C}$
$v_{f @ 48^{\circ} \mathrm{C}}=0.0008996 \mathrm{~m}^{3} / \mathrm{kg}$
$v_{g @ 48^{\circ} \mathrm{C}}=0.015939 \mathrm{~m}^{3} / \mathrm{kg}$

## R-134a

$v_{1}=\frac{V_{1}}{m_{1}}=\frac{V_{1}}{\rho_{1} \times V_{1}}=\frac{1}{\rho_{1}}=\frac{1}{85}=0.011764 \mathrm{~m}^{3} / \mathrm{kg}$
Since $v_{f}<v_{1}<v_{g}$, the $\mathrm{R}-134$ a is a saturated liquid- vapor mixture
$x_{1}=\frac{v_{1}-v_{f}}{v_{g}-v_{f}}=\frac{0.011764-0.0008996}{0.015939-0.0008996}=0.7224$

$$
\begin{aligned}
& u_{f @ 48^{\circ} \mathrm{C}}=119.26 \mathrm{~kJ} / \mathrm{kg} \\
& u_{f g @ 48^{\circ} \mathrm{C}}=135.29 \mathrm{~kJ} / \mathrm{kg}
\end{aligned}
$$

$$
\begin{equation*}
u_{1}=u_{f}+\left(x_{1} \times u_{f g}\right)=119.26+(0.7224 \times 135.29)=216.99 \mathrm{~kJ} / \mathrm{kg} \tag{1}
\end{equation*}
$$

## State 2:

Saturated vapor, therefore,

$$
v_{2}=v_{1}=v_{\mathrm{g}, 2}=0.011764 \mathrm{~m}^{3} / \mathrm{kg}
$$

| $v_{\mathrm{g}, 2}\left(\mathrm{~m}^{3} / \mathrm{kg}\right)$ | $u_{2}=u_{\mathrm{g}, 2}$ <br> $(\mathrm{~kJ} / \mathrm{kg})$ | $T_{2}\left({ }^{\circ} \mathrm{C}\right)$ | P $_{\mathrm{z}}(\mathrm{kPa})$ |

By performing an energy balance on the system:
$\sum_{\text {in }} Q_{\text {in }}+W_{\text {in }}-\sum_{\text {out }} Q_{\text {out }}+$ Whout $^{\text {or }}=\Delta U=m\left(u_{2}-u_{1}\right)$
$m=m_{1}=m_{2}=\rho_{1} \times V_{1}=85 \times 20 \times 10^{-3}=1.7 \mathrm{~kg}$
$Q_{i n}=\mathrm{m}\left(u_{2}-u_{1}\right)=1.7 \times(258.86-216.99)=71.18 \mathrm{~kJ}$

TOTAL

## Solution for Q1(b):

For safety reasons, the temperature of the recovered refrigerant inside the recovery cylinder must not exceed $52^{\circ} \mathrm{C}$. To satisfy this requirement, based on Part (a) answer, the amount of heat (kJ) that needs to be rejected from the refrigerant is to be determined.

By performing an energy balance on the system:

$$
\begin{aligned}
& \sum_{\text {in }} Q_{\text {In }}+W_{\text {in }}-\sum_{\text {out }} Q_{\text {out }}+W_{\text {out }}=\Delta U=\mathrm{m}\left(u_{2 \prime}-u_{2}\right) \\
& Q_{\text {out }}=\mathrm{m}\left(u_{2}-u_{2 \prime}\right)
\end{aligned}
$$

State $2^{\prime}$ is in a saturated-vapor mixture, thus
$u_{2^{\prime}}=u_{f, 2^{\prime}}+\left(x_{2 \prime} \times u_{f g, 2^{\prime}}\right)$
$x_{2 \prime}=\frac{v_{2 \prime}-v_{f,{ }^{\prime}}}{v_{g \prime}-v_{f, 2^{\prime}}}$
Where, $v_{2 \prime}=v_{1}=0.011764 \mathrm{~m}^{3} / \mathrm{kg}$

$$
x_{2 \prime}=\frac{0.011764-0.000915}{0.014265-0.000915}=0.8127 \quad \begin{array}{ll}
u_{f, 2!@ 52^{\circ} \mathrm{C}}=125.33 \mathrm{~kJ} / \mathrm{kg} \\
u_{f g, 2!@ 52^{\circ} \mathrm{C}}=130.88 \mathrm{~kJ} / \mathrm{kg}
\end{array}
$$

$$
u_{2^{\prime}}=u_{f, 2^{\prime}}+\left(x_{2 \prime} \times u_{f g, 2^{\prime}}\right)=125.33+(0.8127 \times 130.88)=231.70 \mathrm{~kJ} / \mathrm{kg}
$$

Q3. (a)
The factors that cause a process to be irreversible are friction, unrestrained expansion, mixing of two fluids, heat transfer across a finite temperature difference, electric resistance, inelastic deformation of solids, and chemical reactions (any two).
b)

Here given,
Qdot $_{H}=650 \mathrm{~kJ} / \mathrm{min}$
Qdot $_{\mathrm{L}}=250 \mathrm{~kJ} / \mathrm{min}$
$\mathrm{TL}=24+273 \mathrm{~K}=297 \mathrm{~K}$
$\eta_{t h}=1-\frac{\dot{Q L}}{\dot{Q} H}=1-\frac{250}{650}=0.615 \approx 61.5 \%$
The highest thermal efficiency for a cyclical engine operating between two specified temperatures can have is the Carnot efficiency, which is determined from:
$\eta_{\text {Carnot }}=1-\frac{T L}{T H}=1-\frac{250}{650}$
$0.615=1-\frac{297}{T H}$
$\mathrm{TH}=771 \mathrm{~K}$
c)
i)
$\eta_{t h}=1-\frac{\dot{Q} L}{\dot{Q} H}=1-\frac{560}{800}=0.30 \approx 30 \%$
ii)
$\eta_{t h, \max }=\eta_{t h, r e v}=1-\frac{T L}{T H}=1-\frac{27+273}{900+273}=0.744 \approx 74.4 \%$
iii)
$C O P_{R, \max }=C O P_{R, \text { revCarnot }}=\frac{T L}{T H-T L}=\frac{-5+273}{27+5}=8.375$
iv)

Wnet,out $=$ Wnet,in= $800-560 \mathrm{~kJ} / \mathrm{min}=240 \mathrm{~kJ} / \mathrm{min}$
$C O P_{R}=\frac{Q L}{\text { Wnet,in }}$
