

SYSTEMATIC METHODOLOGY FOR ESTIMATION OF SYSTEM  
RELIABILITY AT DESIGN PHASE

MOHD ADHAM ISA

A thesis submitted in fulfilment of the  
requirements for the award of the degree of  
Doctor of Philosophy (Computer Science)

Faculty of Computing  
Universiti Teknologi Malaysia

NOVEMBER 2013

I declare that this thesis entitled “*Systematic Methodology For Estimation of System Reliability at Design Phase*” is the result of my own research except as cited in the references. The thesis has not been accepted for any degree and is not concurrently submitted in candidature of any other degree.

Date : 21<sup>st</sup> November 2013

To my beloved parent, wife, children, family, and friends...

## ACKNOWLEDGEMENTS

I would like to express my sincere thanks to Prof. Madya Dr. Dayang Norhayati Abang Jawawi, my supervisor, for her encouragement, guidance and advices. She has corrected all my mistakes patiently and taught me everything that I need not only for the successfulness of my study but also for my life and career. Her continual support, encouragement and inspiration have led me to explore the area of software quality modeling and made this research possible. My sincere appreciation also goes to all of my friends for their continuous help and support.

A special thanks to my beloved parent. Your prayer for me was what sustained me thus far.

I would like to thank my beloved wife, Mastura Md. Hassan and my beloved daughters, Elya and Aafa for their everlasting patience and motivation, which help me through my difficult time. Thank you all.

## ABSTRACT

In software development lifecycle, correctness of system functionality as well as system quality is crucial at the design phase. During this phase, modelling and estimation of system reliability have become more complicated because of the non-systematic methodology for reliability estimation. Complications are due to the strong coupling between reliability design and reliability estimation models, which has resulted in the growing scale of estimated systems. The current reliability estimation methodologies are often executed in isolated models and do not provide expressive reliability design model in terms of reliability requirements, thus leading to inaccurate estimation. Besides that, estimation based on assumptions of these isolation models is prone to human error. Thus, an integrated model comprising new reliability design and reliability estimation models using a systematic methodology for reliability estimation is proposed. The reliability design model is capable of expressing the required reliability requirements whereas the reliability estimation model improves the current estimation accuracy. The modelling and estimation results were evaluated and compared with the existing models and methodologies namely, Core Scenario Model (CSM), Performance Context Model (PCM) and Kernel Language for Performance and Reliability Analysis (KLAPER). The findings showed that the systematic methodology had increased the expressiveness of the reliability design model by 67% and 99.24% for the estimation accuracy. This integrated model using systematic methodology for reliability estimation system would enable developers to systematically estimate system reliability by overcoming the complexity of executed models.

## ABSTRAK

Di dalam kitaran pembangunan perisian, kesahihan kefungsiian dan kualiti sistem adalah sangat penting semasa fasa reka bentuk. Semasa fasa ini, permodelan dan penganggaran kebolehpercayaan sistem menjadi semakin rumit disebabkan oleh metodologi yang tidak sistematik untuk penganggaran kebolehpercayaan. Komplikasi-komplikasi ini disebabkan oleh ikatan yang kuat di antara model reka bentuk kebolehpercayaan dan model penganggaran kebolehpercayaan, di mana telah menghasilkan skala yang berkembang untuk sistem yang dianggarkan. Metodologi-metodologi penganggaran kebolehpercayaan yang sedia ada dilaksanakan secara model terasing dan tidak menawarkan model reka bentuk kebolehpercayaan yang ekspresif di mana akan menjurus kepada anggaran yang kurang tepat. Selain itu, penganggaran berasaskan tanggapan bagi model terasing terdedah kepada kesilapan manusia. Oleh itu, model bersepadu yang mengandungi model baharu untuk reka bentuk kebolehpercayaan dan penganggaran kebolehpercayaan menggunakan metodologi yang sistematik untuk penganggaran kebolehpercayaan dicadangkan. Model reka bentuk kebolehpercayaan mampu untuk menunjukkan keperluan kebolehpercayaan yang diperlukan manakala model penganggaran kebolehpercayaan memperbaiki ketepatan penganggaran. Hasil keputusan kajian untuk permodelan dan penganggaran telah dinilai dan dibandingkan dengan model-model dan metodologi-metodologi yang sedia ada iaitu, *Core Scenario Model (CSM)*, *Performance Context Model (PCM)* dan *Kernel Language for Performance and Reliability Analysis (KLAPER)*. Penemuan kajian menunjukkan metodologi yang sistematik bagi kadar peratusan ekspresif untuk model reka bentuk kebolehpercayaan telah ditingkatkan kepada 67% dan 99.24% untuk ketepatan penganggaran. Model bersepadu yang menggunakan metodologi yang sistematik untuk menganggar kebolehpercayaan sistem akan membolehkan pembangun-pembangun sistem menganggar kebolehpercayaan sistem secara sistematik dengan mengatasi kerumitan model yang dilaksanakan.
