PIONEERING TECHNOLOGY OF THE FUTURE

Vapor Pressure (p*)

Faculty of Petroleum &

- · Volatility of a species is the degree to which the species tends to transfer from the liquid or solid state to the vapor state
 - Highly volatile species tends to be more likely in vapor phase
- · Vapor pressure (p*) a measure of species volatility
 - · The higher the vapor pressure for a given temperature the greater the volatility of species.
 - Vapor pressure is related to boiling liquids with high vapor pressures (volatile liquids) will boil at lower temperatures.
 - · The vapor pressure and hence the boiling point of a liquid mixture depends on the relative amounts of the components in the mixture.

Sem 2 (2013/14) PIONEERING TECHNOLOGY OF THE FUTURE Sem 2 (2013/14) PIONEERING TECHNOLOGY OF THE FUTURE

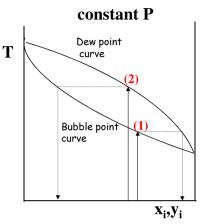

Vapor Pressure (p^*) – Applications in **Chemical Engineering**

p* is used in :

- (1) Bubble P calculations T-xy diagram. (given T, x_i , calculate P, y_i)
- · (2) Dew P calculations T-xy diagram. (given y_i , T, calculate x_i , P)

In general, p^* is crucial (among others) for **VLE** calculations......

Condensation

PIONEERING TECHNOLOGY OF THE FUTURE

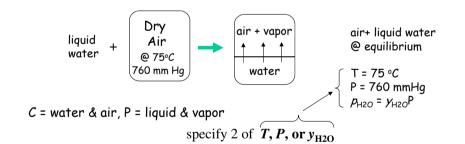

Example II

Faculty of Petroleum &

Air and liquid water are contained at equilibrium in closed container at 75 °C and 760 mmHg. Calculate the molar composition of the gas phase

If a gas at temperature T and pressure P contains a saturated vapor whose mole fraction is y, and if this vapor is the only species that would condense if the temperature were slightly lowered, the partial pressure of the vapor in the gas equals the pure-component vapor pressure P*_i(T) at the system temperature.

Raoult's Law.

single condensable species:

 $p_i = y_i P = p_i * (T)$

Example IV

Faculty of
Petroleum &
Renewable Enei
Engineering

- A stream of air at 100°C and 5260 mm Hg contains 10% water by volume.
- a. Calculate the dew point of the air

- A gas in equilibrium with a liquid must be saturated with the volatile component of that liquid.
- Partial pressure of a vapor at equilibrium in a gas mixture containing a single condensable component <u>cannot exceed</u> the vapor pressure of the pure component in the system; $p_i (= y_i P) \le p^*$
 - \checkmark For a given temperature, a vapor (vapor pressure) present in a gas is less than its saturation amount, $p_i < p^\star$, is called superheated vapor
 - ✓ If a superheated vapor is cooled down at constant pressure, the temperature at which p_i = p^* (saturated vapor) is known as the dew point of the gas
- Any attempt to increase p_i by either adding more vapor or increasing total pressure, would lead to condensation.

b. Calculate the percentage of vapor that condenses and the final composition of the gas phase if the gas is cooled to 80°C at constant pressure.

- · for the entire range of compositions for mixtures of similar substances, e.g. paraffinic hydrocarbon of similar molecular weight

Sem 2 (2013/14)

PIONEERING TECHNOLOGY OF THE FUTURE

A benzene-toluene mixture containing 30 mole% benzene vapor is placed a closed container at 1 atm and 115°C. Is the vapor mixture is in equilibrium with liquid mixture

An equal-molar liquid mixture of benzene (B) and toluene (T) is in equilibrium with its vapors at 50°C. What is the system pressure and composition of the vapor?

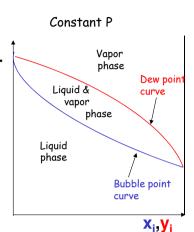

Faculty of

• In a vaporization process of liquid mixture containing several components at constant pressure, the vapor composition will have a composition different from that of the liquid. Т

· As vaporization proceeds the composition of the remaining liquid continuously changes and hence does so its vaporization temperature.

· A similar phenomenon occurs if a mixture of vapors is subjected to condensation at constant pressure - the composition of vapor and the condensation temperature both change.

Bubble Point Calculations for Ideal Liquids Solutions

Bubble-point temperature (T_{bp}) of the liquid - the temperature at which the first bubble vapor forms when the liquid is heated at given pressure

Raoult's law: $p_i = y_i P = x_i p_i^* \left(T_{bp} \right) \quad \text{hence, } \sum y_i = 1 = \frac{\sum_i x_i p_i^* \left(T_{bp} \right)}{P} \quad \text{(trial \& error)}$ Raoult's law:

and Bubble-point pressure (Pbp) of the liquid - the pressure at which the first bubble vapor forms when the liquid is heated at given temperature

$$p_{i} = y_{i} P_{bp} = x_{i} p_{i}^{*}(T)$$

$$\sum y_{i} = 1 = \frac{\sum_{i} x_{i} p_{i}^{*}(T)}{P_{bp}}$$
hence, $P_{bp} = \sum_{i} x_{i} p_{i}^{*}(T)$

PIONEERING TECHNOLOGY OF THE FUTURE

29

Dew Point Calculations for Ideal Vapor Solutions

Faculty of

Dew-point temperature (T_{dp}) of the vapor - temperature at which the first drop of liquid forms when the vapor is cooled at given pressure

Raoult's law:

$$p_{i} = y_{i}P = x_{i}p_{i}^{*}(T_{dp})$$
 hence, $\sum x_{i} = 1 = \frac{y_{i}P}{p_{i}^{*}(T_{dp})}$ (trial & error)

Dew-point pressure (P_{dp}) of the vapor – pressure at which the first drop of liquid forms when the vapor is cooled at given temperature

$$\sum_{i} x_{i} = 1 = P_{dp} \sum_{i} \frac{y_{i}}{p_{i}^{*}(T)} \text{ hence, } P_{dp} = \frac{1}{\sum_{i} \frac{y_{i}}{p_{i}^{*}(T)}}$$
