

1a.

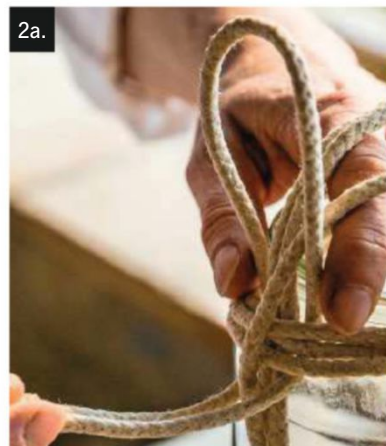

## MAKING THE HANDLE

1b.

**Step 1a and 1b:** The two longest lengths of cord are held together at the 100cm point, then draped over the jar allowing 15cm for the handle. The longest length is wrapped around the jar three times and back over the handle. This is secured temporarily with an elastic band.

**Step 2a and 2b:** One 200cm length of cord is folded in half. The ends are threaded under the cords at the neck of the jar either side of the handle, away from the longer trailing end of cord. These are pulled until a loop appears, then the ends are threaded through and pulled tight to secure.

2a.

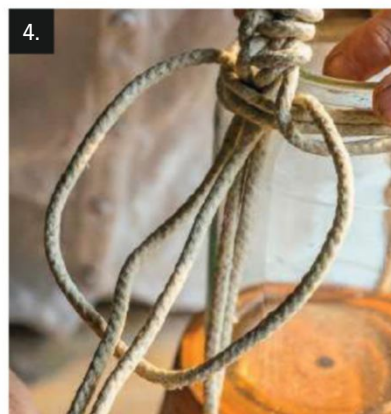

2b.

3.

**Step 3:** The longest end is threaded under the cords at the neck. It is used to make approximately 14 half hitches, working back across the three handle cords.

4.

**Step 4:** Step 2 is repeated to secure the opposite end of the handle. At this point, the handle should be secure and can be taken from the jar and placed on the plant pot. ➤

The half hitch is a simple overhand knot, where the working end of a line is brought over and under the standing part. This diagram shows two half hitches.
