

Forest paths

Forest paths provide distinctive walking experiences. Dark and gloomy in cloudy weather or animated and dappled in sunlight, forest paths are dynamic. Ground becomes soft, mossy and damp. These paths are strangely silent. As they are walked, tree trunks orbit, slide and

migrate from view, grouping behind each other like figures in a crowd. Timelessness is somehow conveyed in the extent of repeated trunks (see also Spaces/Formalised forest, p. 65). Forest paths form systems and networks associated with nodal glades (see Spaces/Glades, p. 64).
