

of a thick chipboard base with deep grooves marking out a checkerboard pattern enclosing 1-m squares at a scale of 1:20. Into these grooves partition walls, window or door units could be placed (Figures 5.34 to 5.37). A thick perspex sheet with a pattern of grooves similar to those on the base represented the first floor. The two floors were separated by pegs at the corners being kept apart at the scale height of the floor. In addition to the wall panels, model staircases of different forms, and furniture and fittings were provided. Each family worked with an architect to design the home of their dreams. The family was allocated the number of squares permitted by the standards for its family size. The architects' role was a difficult one of giving advice only when it was requested. At all times the aim was to try to place control in the hands of the families. The architect could intervene only if he or she could see mistakes of a structural or geometrical nature. Within a threehour evening session, most families had prepared a
