Benefit Cost Analysis

Techniques for Cash Flow Analysis

- ▶ Present Worth Analysis
- ▶ Annual Cash Flow Analysis
- ▶ Rate of Return Analysis
- ▶ Incremental Analysis
- ▶ Other Techniques:
 - ▶ Future Worth Analysis
 - ▶ **Benefit-Cost Ratio Analysis**
 - ▶ Payback Period Analysis

Benefit-Cost Analysis

- ▶ The Benefit-cost analysis is commonly used to evaluate public (government) projects.
- ▶ Benefits of a nonmonetary nature need to be quantified in dollar terms as much as possible and factored into the analysis.
- ▶ A broad range of project users distinct from the sponsor should be considered—benefits and costs to all these users can (and should) be taken into account.

Benefit-Cost Ratio Criterion

- ▶ The Net B/C ratio expresses the net benefit expected per dollar invested.

Benefit - Cost Ratio (B/C)

$$\begin{aligned} &= \frac{\text{Equivalent Net Benefits}}{\text{Equivalent Net Costs}} \\ &= \frac{\text{PW of Benefits}}{\text{PW of Costs}} = \frac{\text{EUAB}}{\text{EUAC}} \end{aligned}$$

- ▶ **Decision Rule: If B/C ratio > 1, the project can be justified/acceptable.**

Example 1: Benefit-Cost Ratio Computation

- ▶ Compute Benefit-Cost Ratio for given CFD:

- ▶ **Solution:**
- ▶ Benefit, $B = \$20 (P/F, 10\%, 2) + \$30 (P/F, 10\%, 3) + \$30 (P/F, 10\%, 4) + \$20 (P/F, 10\%, 5) = \$71.98$
- ▶ Cost, $C = \$10 + \$10 (P/F, 10\%, 1) + \$5 (P/A, 10\%, 4) (P/F, 10\%, 1) = \25
- ▶ Benefit-cost ratio = $B/C = 72/25 = 2.88 \Rightarrow$ Accept the project

Example 2: B/C Ratio Analysis

- ▶ Each of the five mutually exclusive alternatives presented below will last for 20 years and has no salvage value. MARR = 6%.

	A	B	C	D	E	F
PWC	\$4,000	\$2,000	\$6,000	\$1,000	\$9,000	\$10,000
PWB	\$7,330	\$4,700	\$8,730	\$1,340	\$9,000	\$9,500
B/C	1.83	2.35	1.46	1.34	1.00	0.95
NPV	\$3,330	\$2,700	\$1,730	\$340	0	-\$500

- ▶ The steps are the same as in incremental ROR, except that the criterion is now B/C, and the cutoff is 1 instead of the MARR:
 - ▶ 1. Be sure you identify all alternatives.
 - ▶ 2. (Optional) Compute the B/C ratio for each alternative. Discard any with a $B/C < 1$. (We can discard F).
 - ▶ 3. Arrange the remaining alternatives in ascending order of investment.

Example 2: Cost Ratio Analysis

	D	B	A	C	E	F
Cost	\$1000	\$2000	\$4000	\$6000	\$9000	\$10000
PWB	\$1340	\$4700	\$7330	\$8730	\$9000	\$9500
B/C	1.34	2.35	1.83	1.46	1.00	0.95
NPV	340	2700	3330	1730	0	-500

4. Comparing $\Delta B/\Delta C$ with 1 for consecutive alternatives select the best alternative.

	B-D	A-B	C - A	E-A
Incremental Cost	\$1000	\$2000	\$2000	\$5000
Incremental Benefit	\$3360	\$2630	\$1400	\$1670
Incr.B/Incr. C	3.36	1.32	0.76	0.33

- ▶ Thus, for the example, the increments B-D and A-B are attractive. We prefer B to D, and we prefer A to B. Increment C-A is not attractive, as $\Delta B/\Delta C = 0.76 < 1$. Comparing A to E, again A is best. Finally A is the best project.

Example 2: Cost Ratio Analysis

- ✓ A, B, C, and D are above the 45-degree line; their B/C ratio is > 1 .
- ✓ F is below the line: B/C ratio is < 1 .
- ✓ We can discard F if we wish.

Examine each separable increment of investment.
 $\Delta B/\Delta C < 1 \Rightarrow$ increment is not attractive
 $\Delta B/\Delta C \geq 1 \Rightarrow$ increment is desirable.

Begin with D & B: $\Delta B/\Delta C > 1$. B “wins”.
 Next consider A: $\Delta B/\Delta C > 1$. A “wins”.
 C: $\Delta B/\Delta C < 1$; discard C.
 E: $\Delta B/\Delta C < 1$; discard E.
 F was discarded earlier
 Conclude A is best.
 Note: Alt. B has the highest B/C ratio

	B-D	A-B	C - A	E-A
Incremental Cost	\$1000	\$2000	\$2000	\$5000
Incremental Benefit	\$3360	\$2630	\$1400	\$1670
Incr.B/Incr. C	3.36	1.32	0.76	0.33

Example 3: Cost Ratio Analysis

- ▶ You are deciding between three alternatives and you need to pick the best one. The lifetimes of all machines is 20 years. Assuming a 5% interest rate, which machine should you select?
- ▶ Use B/C ratio to make your decision.

	Alternative A	Alternative B	Alternative C
Benefits			
Taxes	\$7,000 per year	\$3,000 per year	\$8,000 per year
Salvage Value	\$30,000	\$15,000	\$25,000
Costs			
First Cost	\$45,000 (present)	\$25,000 (present)	\$65,000 (present)
Operating Expenses	\$1,500 per year	\$2,500 per year	\$1000 per year
Maintenance Costs	\$2,000 per year	\$3,000 per year	\$1500 per year
Lifetime	20 years	20 years	20 years

Example 3: Benefit-Cost Ratio Analysis

▶ **Solution:**

▶ Analysis of Alternative A

▶ B/C ratio for Alt A = Benefits/Cost

$$\text{▶ } = [7,000 (P/A, 5\%, 20) + 30,000 (P/F, 5\%, 20)] / [45,000 + (1,500+2000) (P/A, 5\%, 20)]$$

$$\text{▶ } = 98,542/88,617 = 1.1199 > 1 \text{ (Good)}$$

▶ Analysis of Alternative B

▶ B/C ratio for Alt B = Benefits/Cost

$$\text{▶ } = [3000 (P/A, 5\%, 20) + 15,000 (P/F, 5\%, 20)] / [25,000 + (2,500+3000) (P/A, 5\%, 20)]$$

$$\text{▶ } = 43,040 / 93,542 = 0.4601 < 1 \text{ (Bad, Not good)}$$

▶ If we do the same for Alternative C we get a B/C ratio of 1.135, which is > 1 (Good)

Example 3: Cost Ratio Analysis

	Alternative A	Alternative B	Alternative C	(C - A)
Benefits				
Taxes	\$7,000	\$3,000	\$8,000	\$1,000
Salvage Value	\$30,000	\$15,000	\$25,000	(\$5,000)
Costs				
First Cost	\$45,000	\$25,000	\$65,000	\$20,000
Operating Expenses	\$1,500	\$2,500	\$1,000	(\$500)
Maintenance Costs	\$2,000	\$3,000	\$1,500	(\$500)
Lifetime	20 years	20 years	20 years	
Benefits	\$98,542.4000	\$43,040.1000	\$109,120.1000	\$10,577.7000
Costs	\$88,617.70	\$93,542.10	\$96,155.50	\$7,537.80
B/C Ratio	1.111994556	0.46011475	1.134829521	1.403287431
Decision	Good, Compare	Not Good, Eliminate	Good, Compare	Good, prefer C

Example 3: Cost Ratio Analysis

- ▶ Note that the benefits and costs are obtained from the previous analysis (we made the analysis in terms of Present Worth).
- ▶ For example, for Alternative A:
 - ▶ Benefits = $7,000 (P/A, 5\%, 20) + 30,000 (P/F, 5\%, 20) = \$98,542$
 - ▶ Costs = $45,000 + (1,500+2000) (P/A, 5\%, 20) = \$88,617$
- ▶ In this case, since Incremental B/C of $(C-A) = 1.40$ we prefer Alternative C over Alternative A.
- ▶ Since we have no more alternatives we decide that Alternative C is the best one.

Other Analysis Techniques

- ▶ **Future worth analysis** is equivalent to present worth analysis. There are many situations where we want to know what a future situation will be, if we take some particular course of action now. This is called future worth analysis.
- ▶ **Payback period** is an approximate analysis method. For example, if a \$1000 investment today generates \$500 annually in savings, we say its payback period is $1000/500 = 2$ years.
- ▶ **Sensitivity analysis** identifies how sensitive economic conclusions are to the values of the data, and allows making decisions for an entire range of the data.
- ▶ **Breakeven analysis** is closely related to sensitivity analysis, and determines conditions when two alternatives are equivalent (as well as when each is better than the other). It can be viewed as a type of sensitivity analysis.

9-29

- ▶ A project will cost \$50,000. The benefits at the end of the first year are estimated to be \$10,000, increasing at a 10% uniform rate in subsequent years. Using an 8-year analysis period and a 10% interest rate, compute the benefit-cost ratio.

- ▶ Geometric gradient at a 10% uniform rate.

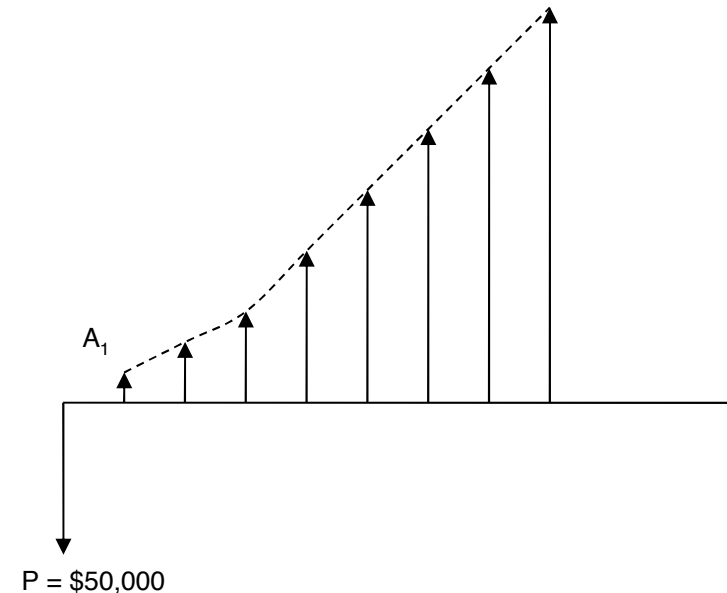

- ▶ $A_1 = \$10,000$

- ▶ $i = 10\%$

- ▶ $g = 10\%$

- ▶ $n = 8 \text{ yrs}$

- ▶ Where $i = g$: $P = A_1 n (1 + i)^{-1}$

- ▶ $B/C = \text{PW of Benefits} / \text{PW of Cost} = [\$10,000 (8) (1 + 0.10)^{-1}] / \$50,000$

- ▶ $B/C = 1.45$

9-30

Each of the three alternatives shown has a 5-year useful life. If the MARR is 10%, which alternative should be selected? Solve the problem by benefit–cost ratio analysis.

	<i>A</i>	<i>B</i>	<i>C</i>
Cost	\$600.0	\$500.0	\$200.0
Uniform annual benefit	158.3	138.7	58.3

- ▶ $B/C_{\text{OFA}} = \$158.3/[\$600 (A/P, 10\%, 5)] = 1.00$
- ▶ $B/C_{\text{OFB}} = \$138.7/[\$500 (A/P, 10\%, 5)] = 1.05$
- ▶ $B/C_{\text{OFC}} = \$58.3/[\$200 (A/P, 10\%, 5)] = 1.11$

- ▶ All alternatives have a B/C ratio > 1.00. Proceed with incremental analysis.

9-30

	B- C	A- B
Cost	\$300	\$100
Uniform Annual Benefit	\$80.4	\$19.6

Incremental Analysis

$$B/C_{\text{OF B-C}} = \$80.4 / [\$300 (A/P, 10\%, 5)] = 1.02$$

Desirable increment. Reject C.

$$B/C_{\text{OF A-B}} = \$19.6 / [\$100 (A/P, 10\%, 5)] = 0.74$$

Undesirable increment. Reject A.

Conclusion: Select B.

9-31

- ▶ Consider three alternatives, each with a 10-year useful life. If the MARR is 10%, which alternative should be selected? Solve the problem by benefit-cost ratio analysis.

	<i>A</i>	<i>B</i>	<i>C</i>
Cost	\$800	\$300	\$150
Uniform annual benefit	142	60	33.5

B/C ratio

$$B/C_A = (\$142 (P/A, 10\%, 10))/\$800 = 1.09$$

$$B/C_B = (\$60 (P/A, 10\%, 10))/\$300 = 1.23$$

$$B/C_C = (\$33.5 (P/A, 10\%, 10))/\$150 = 1.37$$

9-31

▶ Incremental Analysis

▶ B- C Increment

▶ $\Delta \text{ Cost}_{(B-C)} = \150

▶ $\Delta \text{ UAB} = \$26.5$

▶ $\Delta B/\Delta C = (\$26.5 (P/A, 10\%, 10))/\$150 = 1.09$

▶ This is a desirable increment. Reject C.

▶ A- B Increment

▶ $\Delta \text{ Cost}_{(A-B)} = \500

▶ $\Delta \text{ UAB} = \$82$

▶ $\Delta B/\Delta C = (\$82 (P/A, 10\%, 10))/\$500 = 1.01$

▶ This is a desirable increment. Reject B.

Conclusion: Select A.

9-33

Using benefit–cost ratio analysis, determine which one of the three mutually exclusive alternatives should be selected.

	<i>A</i>	<i>B</i>	<i>C</i>
First cost	\$560	\$340	\$120
Uniform annual benefit	140	100	40
Salvage value	40	0	0

B/C ratio

$$\begin{aligned}\text{Alternative A: B/C} &= [\$140 (P/A, 10\%, 6)]/[\$560 - \$40 (P/F, 10\%, 6)] \\ &= [\$140 (4.355)]/(\$560 - \$40 (0.5645)) \\ &= 1.13\end{aligned}$$

$$\begin{aligned}\text{Alternative B: B/C} &= [\$100 (P/A, 10\%, 6)]/\$340 \\ &= 1.28\end{aligned}$$

$$\begin{aligned}\text{Alternative C: B/C} &= [\$40 (P/A, 10\%, 6)]/\$120 \\ &= 1.45\end{aligned}$$

9-33

	B- C	A- B
Δ First Cost	\$220	\$220
Δ Uniform Annual Benefit	\$60	\$40
Δ Salvage Value	\$0	\$40
Compute $\Delta B/\Delta C$ value	1.19	0.88

Incremental Analysis

$$\text{B- C} \quad \Delta B/\Delta C = [\$60 (P/A, 10\%, 6)]/\$220 = 1.19$$

B- C is a desirable increment.

$$\text{A- B} \quad \Delta B/\Delta C = [\$40 (P/A, 10\%, 6)]/[\$220 - \$40 (P/F, 10\%, 6)] = 0.88$$

A- B is an undesirable increment.

Conclusion: Choose B.

9-33

▶ NPW Solution

▶ $NPW_A = \$140 (P/A, 10\%, 6) + \$40 (P/F, 10\%, 6) - \$560$
▶ $= \$140 (4.355) + \$40 (0.5645) - \$560$
▶ $= +\$72.28$

▶ $NPW_B = \$100 (P/A, 10\%, 6) - \340
▶ $= +\$95.50$

▶ $NPW_C = \$40 (P/A, 10\%, 6) - \120
▶ $= +\$54.20$

Select B

9-33

▶ Rate of Return Solution

	B- C	A- B
Δ Cost	\$220	\$220
Δ Uniform Annual Benefit	\$60	\$40
Δ Salvage Value	\$0	\$40
Computed Δ ROR	16.2%	6.6%
Decision	> 10% Accept B. Reject C.	< 10% Reject A.

Select B.
