

The cost of Implementing TPM

- ▶ SMN 4842
- ▶ Sem 2 20102011

The cost of Implementing TPM

- ▶ The Major Cost elements:
 - Direct cost of TPM team member
 - Direct cost of other company personal
 - The cost of external resources
 - The cost of spare parts, materials and other purchase items
 - Training and consultancy support costs
 - Lost production cost revenue resulting from the need to stop the process whilst TPM activities take place

The Financial Benefits of Implementing TPM

- ▶ OEE is direct measure of earning capacity of facilities, can be used to measure the financial benefits arising from TPM applications
- ▶ The process in the company add value (value added) to materials or parts

The Financial Benefits of Implementing TPM

- ▶ Example of a press machine used to produce parts from blank sheets
 - Cost of blank sheet = RM 5
 - Value of pressed part = RM 7
 - Added value = $RM7 - RM5 = RM 2 / \text{part}$
 - The process has earned RM 2 for the company. If the expected throughput is 50 panels per hour, the added value per hour is
$$\text{added value/hour} = RM2 \times 50 = RM100/\text{hour}$$
(expected throughput is the theoretical cycle time)

The Financial Benefits of Implementing TPM

- ▶ Due to six major losses, the effectiveness of the press machine is only 70%, then the actual value added per hour is

$$\begin{aligned}\text{Actual value added per hour} &= \text{RM}100 \times 0.7 \\ &= \text{RM}70/\text{hour}\end{aligned}$$

$$\begin{aligned}\text{The loss of added value due to six major losses is} \\ &= \text{RM}100 \times (100\% - 70\%) \\ &= \text{RM}30\end{aligned}$$

The Financial Benefits of Implementing TPM

- ▶ If the press were used on a single shift basis and operated on average 35 hours per week and 48 weeks per year,

$$\begin{aligned}\text{The average loading time/year} &= 35\text{hrs} \times 48 \text{ wks} \\ &= 1680 \text{ hrs/year}\end{aligned}$$

Annual loss is a calculated based on the loading hour and loss per hour

$$\text{Annual loss} = \text{RM}30 \times 1680 = \text{RM}50,400/\text{year}$$

The Financial Benefits of Implementing TPM

- ▶ The implementation of TPM will increase the OEE, therefore will increase earning capacity of the process.

- ▶ For each 1% improvement in OEE the earning gains is,

$$\begin{aligned}\text{Loss of effectiveness} &= 100\% - 70\% \\ &= 30\% = \text{RM } 50,400\end{aligned}$$

$$\begin{aligned}1\% \text{ improvement} &= \text{RM } 50,400 / 30\% \\ &= \text{RM } 1680 / \text{per cent}\end{aligned}$$

The Financial Benefits of Implementing TPM

- ▶ For improvement in OEE is at 5%
 - The increase in earning capacity = $\text{RM}1680 \times 5$
= RM 8400
 - If improvement in OEE is at 10%, the increase in earning capacity is RM 16800.

The Financial Benefits of Implementing TPM

- ▶ Let say the cost of implementing TPM is;
 - The direct cost of TPM team member = RM 1300
 - The direct cost of other company personnel = RM 360
 - The cost of external service = RM 250
 - The cost of spare parts, materials and other purchased items = RM 500
 - Training and consultancy support costs = RM 2500
 - Total cost = RM 7710

The Financial Benefits of Implementing TPM

- ▶ The financial justification for undertaking TPM on the press machine can be based by the pay back period for the investment in TPM
- ▶ 5% improvement = $\text{RM}7710 / \text{RM}8400$
= 0.92 year (11 months)
- ▶ 10% improvement = $\text{RM}7710 / \text{RM} 16899$
= 0.46 year (5.5 months)
